The conductivity electrode EC-1, the desalting controller RD-1 and the continuous desalting valve with servomotor allow the automatic desalting process of boiler water which eliminates:

- Organic matter and mineral salts in solution. (Calcium, magnesium, sodium, potassium, iron, bicarbonate ions, chlorides, sulphates, nitrates, ...etc.).
- Solid materials in suspension. (Sand, clay, metal residues, rock residues, organic matter, ...etc.).

The continuous bleeding process prevents:

- Damage caused by erosion and perforation, entailing the following high costs:
  - Direct: Replacement or repair of materials.
  - Indirect: Stoppages, product losses, ...etc.
- Danger of boiler explosion.

and reduces:

- Incrustations and sediments caused by precipitation of calcium and magnesium salts, which obstruct thermic transmission and which cause unnecessary and excessive fuel consumption.
- Foam formation caused by excessive saline concentration, with its corresponding drag. This combination of measuring comparison and control ensures minimum water loss and thus gives considerable energy savings.

Nominal pressure: PN-40.

Flange connection: DN-15 and 20 (EN-1092-1).

Conforms to the low voltage directive 73/23/CE version 93/68/CE.
According to the electromagnetic compatibility directive 89/336/CE version 93/68/CE.

Specifications

- The unit consists of a Continuous desalting valve with servomotor, a Conductivity electrode EC-1 and Desalting controller RD-1 with or without assembly cupboard.

**Continuous desalting valve with servomotor**

1. Faucet for taking samples: Makes process of analysing the salt concentration of boiler water easier. Possibility of guided connection for pipes with a Ø of 6/8 mm.
2. Reader plate: Allows bleeding positions to be seen clearly and concisely, even from some distance away.
3. Plug for draining the measuring nozzle.
4. Measuring nozzle: Acts as a valve, measuring and control organ. The water under pressure expands silently and gradually into it. Thus, dirt, incrustations and salt deposits are removed. Due to this gradual expansion, the system does not suffer erosion.
5. Servomotor mounted on the valve on an angle mounting. A synchronised reversible motor is used as a transmission element. Via gearing it adjusts the position of the regulation lever.
Operation
If the accepted conductivity value previously selected is exceeded the desalting controller RD-1, via indication from the conductivity electrode EC-1, operates the servomotor and opens the continuous desalting valve to the OPEN position. When the conductivity decreases the adjustment mechanism returns to the SERVICE position giving continuous economical desalting. When the "valve closed" switch is on the adjustment mechanism automatically puts the valve in the CLOSED position. These positions are fixed by the micro limit switches.

Adjustment of micro limit switches

The micro limit switches come ready adjusted from the factory:

<table>
<thead>
<tr>
<th>Micro switch position</th>
<th>Position of the lever on the indicator plate</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) CLOSED</td>
<td>0</td>
</tr>
<tr>
<td>(2) SERVICE</td>
<td>8</td>
</tr>
<tr>
<td>(3) OPEN</td>
<td>35</td>
</tr>
</tbody>
</table>

Using a screwdriver the positions of the micro switch can be readjusted. Turning the right to left decreases the purge position and turning it the left to right increases it.

Manual or automatic operation

To operate the valve manually:
1- Cut off the power supply.
2- Mark the position of the regulation lever on the indicator plate.
3- Push the connection against the spring and turn it 90°.
4- Place the regulation lever in the required position.

Restoring automatic operation:
1- Place the regulation lever in the position marked on the indicator plate.
2- Turn the connection 90° and fit it in the axis of the measuring nozzle.
3- Reconnect the power supply.

Servomotor

Reversible synchronised motor.
Gearbox with permanent lubrication.
Voltage: 220 V.A.C. ± 10% 50/60 Hz.
Commutated micro limit switches: 3.
Adjustment time: 135 s/90°.
Cell: Maximum load. 15 Nm.
Ambient temperature: 50°C.
Protection: IP-54.
Connection: Whitworth gas-tight cylindrical male thread ISO 228/1 1978 (DIN-259) 1”.
Maximum operating temperature: 238°C.
Maximum operating pressure: 32 bar.
Protection: IP-65.

**Conductivity electrode. EC-1**

Nominal pressure: PN-40.
Allowable pressures and temperatures according to DIN-2401. Sheet 2.
Flange connection: DN-20 (EN-1092-1).
Electrode connection: Whitworth gas-tight cylindrical female thread ISO 228/1 1978 (DIN-259) 1”.

We recommend adding a blowoff valve to the equipment, Mod. 999, 1/2” joined to the waste pipe for periodic release of sludge. As a minimum a 2 ÷ 3 second release must be performed every 8 hours.

**Desalting controller. ARD-1, RD-1**

Voltage: 220 V.A.C. ± 10% 50/60 Hz.
Electric consumption: Approximately 4,5 VA.
Relay contact: 250 V/4 A 750 VA.
Safety contact: Maximum 2A-Mitteltraeg.
Ambient temperature: -20 to + 70°C.
Regulator protection: IP - 00.
Regulator protection in assembly cupboard: IP - 50.
Regulation index: 2,5 to 20 mS.
Limit index: 40 to 75 mS.

- Desalting controller with assembly cupboard ARD-1.
- Desalting controller without assembly cupboard RD-1.

The desalting controller without assembly cupboard RD-1 is supplied in a 19” sub-rack according to DIN-41494.
The effect is achieved when the salts are removed continuously and without movement to prevent uncontrolled water losses from the boiler.

The water to be bled in relation to the steam produced is:

\[ P = \frac{M}{(S-M)} \cdot Q \]

Using the calibrated scale, the lever allows exact adjustment of the measuring nozzle. We shall set the lever at the position that allows us to remove a volume of water (P) at a differential pressure. Differential pressure = Working pressure - (Back pressure + Load losses). Continuous desalting is achieved with adjustment values of 0 to 35.

The position "Direct bleeding" corresponds to the section of nozzle that is totally open and allows complete bleeding in a few seconds. In this case, the volume is approximately three times greater than that for 35 on the scale.

The combination of the Continuous desalting valve* and the Blowdown valve for bleeding dirt and sludge** is essential for optimizing the boiler's efficiency, and includes its maximum security and availability. Neither of them can be replaced with others not designed for this specific application. Their moderate cost is depreciated in the short term.
